Biological perspectives on social behavior have been a source of public controversy since at least the “Sociobiology Debate” of the mid 1970s. Nowadays “Darwinizing Culture” has become prominent and it is this latter phenomenon that this course specifically seeks to address. However, it is no longer a straightforward issue of dismissing evolutionary approaches as sociologically and politically incorrect given that Darwinian perspectives today are themselves often sociological in character and may even be intertwined with liberal/left political views. Not infrequently obscured in the exchanges between opposing viewpoints are ways in which biological and sociological approaches may complement, supplement or even converge with one another. In this context, our concerns in this class are: 1) to examine a series of intriguing ideas spawned by evolutionary thinking; 2) to focus on several domains of human culture: morality and religion, gender norms and standards of beauty as well as literature or film from a Darwinian vantage point.

Darwinians seldom speak with one voice about human culture and social behavior. In some sense, the real “Darwin Wars” are waged among those committed to an evolutionary perspective but who nonetheless disagree about how far this logic should be extended to account for human society and culture. Some arguments are compelling, others controversial or provocative. Despite claims to scientific status, conclusions grounded in evolutionary theory often represent an interplay of theory and interpretation, of logic and intuitive insight, of empirical evidence as well as social commitments. It is the intersection of these dimensions that forms the space which we will explore and attempt to navigate over the course of the semester.
